

Managing Your Files Online

While the whole world seems to be rushing into a digital only age businesses are being left behind. Paperwork is something that will not and cannot be done away with in the professional world. Managing of this paperwork is often times very inefficient. The problem grows even worse when an organization spans several physical locations. Employee retention is also another problem, ex: a secretary who has filed everything quits and now you need a file ASAP but nobody has any clue where it is. Existing solutions to these problems are archaic, lack web connectivity, and are not easy to use.

To solve these above problems I propose the creation of an online file management system that would keep track of the physical location of documents, record metadata about the files, smartly manage the insertion of new files, provide a smart search to find existing files, provide a easy to use user interface, and work on existing mobile platforms.

Beneficial skill sets:

Web programing (html/css/javascript/ajax), sql, apache, or Ruby on Rails
