Desktop Web Storage Application

We are planning on developing a sort of desktop web storage application. It seamlessly integrates the benefits of web storage without having to actually get on a web browser. The desktop interface will seemingly function the same as your local hard disk. The user can drag and drop files directly onto the interface, and the files will be queued for upload to the web server. From the web server the user can monitor his/her files, view logs on what's been changed/deleted/uploaded. Even possibly share files with other members. Prefer someone who has experience with programming Windows GUI's. Knowledge of networking and web interfaces a plus. Email marti221@unr.nevada.edu for more info.
