For this assignment you have to decide on a UML-centered topic, select three related technical articles, and write critical summaries for all of them (each summary between 400 and 500 words).

In the assignment you should indicate the selected topic’s title and the complete references for the articles (authors, title, volume, place of publication, date, pages). Each summary should concisely describe the article’s main goal(s), the most important ideas put forth by the authors, several details you find interesting, and your personal views on the material presented.

The articles should be of medium size (e.g., 4 to 10 pages ACM Computers or IEEE Software format) and should be either journal or conference publications. Attach to your assignment hardcopies of the articles selected and, before the due date, hand-in the assignment to the instructor in room SEM-236.
