

## Learning by Analyzing differences: Positive and negative examples

- Learning from carefully crafted examples
- 
- The brick-top must be supported by pillars
- 
- The pillars must not touch
- 
- Top can be a wedge or a brick

## Responding to near misses (negative examples) impr

- Here's an initial description and successive modifications to the model as it evolves

(a) Arch

(b) Near miss

(c) Arch

## Supports must not touch

(a) Arch

(b) Near miss

(c) Arch

## Brick or wedge? Positive example of another arch

Negative examples:

Generalize or Specialize?

Positive Examples:

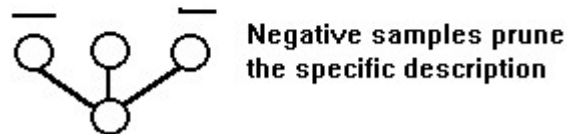

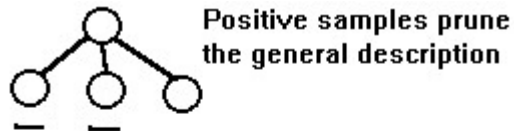

Generalize or Specialize?

# Version Spaces: Learning by managing multiple models

○ The most general model;  
matches everything

○ The most specific model;  
matches only thing

1. Each time a general model is specialized, that specialization must be a generalization of an existing specific model. Similarly each time a specific model is generalized, that generalization must be a specialization of an existing general model
2. Each time a general model is specialized, that specialization must not be a specialization of another general model
